Kaput-D® Burrow Builder Pocket Gopher Bait

World Leader in Pocket Gopher Bait Research & Development

Labeled for use against pocket gopher species in the US. This grain formulation contains 0.005% Diphacinone.

In May 2007, the EPA approved the use of our pocket gopher bait in mechanical burrow builders. This product is classified as a RESTRICTED USE PESTICIDE, and can only be used by someone who is licensed within the state of application, or under their direct supervision.

The equipment constructs an underground, artificial burrow system for pocket gophers. As the tractor draws the equipment along, similar to a corn planter, the hopper is calibrated to drop bait directly into the tunnel. Since pocket gophers live underground and in digging new tunnels almost daily, their efforts eventually intersect these artificial runways. Gophers take advantage of these new trails, and in doing so, encounter the bait, feed on some and take the remainder back to the nest.

In studies we conducted during the early 1990's we used radio collars on gophers and were able to track individual gophers moving as far as 100 yards within an hour along one of these artificial burrows. In research we performed several years ago, we placed underground bait stations intersecting gopher tunnels. These digging rodents removed the 2 lbs of bait in each station, including paraffin blocks (1-oz each) within three days! The bait was moved to their nests.

Make certain to read the label carefully and call us should you have questions.
